Description
DNS Reconnaisance is part of the information gather stage of hacking or penetration testing. Before the adversaries perform the exploit, they attempt to obtain information regarding the DNS servers and the DNS records. This type of information gives them a better understanding about the organization's network infrastructure. This type of reconnaissance is usually unlikely to go recognized and the reason is

After assigning my friend as the incident responder for some reasons someone decided to compromise the mission as we can see on this picture just when he responded.

4 STIX is a standardized language used to describe and share cyber threat intelligence in a machine-readable format. Instead of manual reports, it allows security tools to exchange data about hackers, malware, and attack patterns automatically.

STIX enhances a SIEM by providing a standardized, machine-readable language that allows the system to automatically ingest and share threat intelligence. It transforms raw logs into actionable insights by adding context, such as identifying if an IP address is linked to a specific malware campaign or threat actor. This enables the SIEM to prioritize alerts based on real-world risk and automate the detection of sophisticated attack patterns across the network.
